

Introduction:

The Paying Guest Management System project aims to simplify the rental process for hosts and guests. It provides a centralized platform for room postings, bookings, payments, and reviews, ensuring efficient management and enhanced communication between all parties involved.

Background Study

The Paying Guest Management System is a software application that allows hosts to manage their tenants and accommodation details in one place. The system has three types of users: admin, guest, and host. The host can post a room with details that can be edited, activated, or deactivated. If the posted room is empty, then a guest can book the room, and the booking status changes to booked. The booking request is sent to the admin. The admin can either reject or confirm the booking request. If the admin confirms the booking request, then the booking room details show up on the check-in page, where the guest can check in. If the admin rejects the booking request, then the booking status will be empty. If the guest checks out of the room, then the booking status will be changed to empty. After checkout, the guest and host can share their reviews with each other. The guest can pay the room rent using the bkash number and transaction ID. The payment request is sent to the admin to verify the details of payment. If the admin confirms the payment, then all information is stored and shown in the history of the host and guest dashboard. If the admin rejects the payment, then it will again show up on the guest dashboard to submit details again. If the guest pays their rent for the desired posted room, then the host can request a payment withdrawal request to the admin. The admin will pay the desired payment for the host. In conclusion, the paying guest management system provides a streamlined process for booking, payment, and checkout, making it easier for both hosts and guests to manage their stay. The system also allows for reviews to be shared between guests and hosts, providing valuable feedback for future improvements. Overall, the paying guest management system is an excellent tool for anyone looking to manage their rental properties more efficiently.

Requirement Analysis:

1. User Category:

There are 3-types of Users here. They are:

- Host
- Guest
- Admin

2. Feature List:

In this project the “User Type Guest” has the following features:

- Dashboard
- Profile
- Review

Paying Guest Management System

- Billing
- History
- Update password
- Logout

In this project the “User Type Host” has the following features:

- Dashboard
- Profile
- Make a post
- View all post
- View booked post
- Review
- History
- Update password
- Logout

In this project the “User Type Admin” has the following features:

- Dashboard
- Billing conformation

Impact of this Project:

The Paying Guest Management System is increasingly vital in modern society as it streamlines the rental process, enhances security, and promotes sustainability by reducing paperwork. It benefits people by providing a convenient, transparent, and efficient platform for managing accommodations, fostering a better rental experience.

Limitations and Possible Future Improvements:

Current limitations include potential technological barriers for some users. Future improvements could involve AI-driven recommendations, multilingual support, and advanced analytics for hosts and guests.
